Module 4: Alternative approaches

2-step Semi-supervised Approach

1. Regress the surrogate on the features with penalized least square to get the direction of beta.

```
\# COD + NI.P + HU.
x <- ehr_data_transformed %>% select(starts_with("health")
  starts with("COD") | starts with("NLP"))
S <- ehr data transformed$main NLP
# Step 1.
beta_step1 <- adaptive_lasso fit(</pre>
 y = S, # surrogate
 x = x, # all X
  family = "gaussian",
 tuning = "cv"
```

2-step Semi-supervised Approach

- 1. Regress the surrogate on the features with penalized least squares to get the direction of beta.
- 2. Regress the outcome on the linear predictor to get the intercept and multiplier for the beta.

```
# Linear predictor without intercept.
bhatx <- linear model predict(beta = beta step1, x = as.matrix(x))</pre>
# Step 2.
step2 <- glm(
 train y ~ bhatx[train data$patient id] + S[train data$patient id],
 family = "binomial"
beta_step2 <- coef(step2)
beta step2
##
                     (Intercept) bhatx[train data$patient id]
##
                     -0.3504483
                                                     1.2620270
##
       S[train_data$patient_id]
##
                      0.4012988
# Recover heta
beta <- beta step2[2] * beta step1
```

Compare selected features
