Module 4: Alternative approaches

2-step Semi-supervised Approach

1. Regress the surrogate on the features with penalized least square to get the direction of beta.

```r
x <- log(ehr_data %>% select(starts_with("health") |
  starts_with("COD") | starts_with("NLP")) + 1) # COD + NL
S <- log(ehr_data$main_ICD + ehr_data$main_NLP + 1)

# Step 1
beta_step1 <- adaptive_lasso_fit(
  y = S[], # surrogate
  x = x[], # all X
  family = "gaussian",
  tuning = "ic"
)
```

2-step Semi-supervised Approach

1. Regress the surrogate on the features with penalized least square to get the direction of beta.

2. Regress the outcome on the linear predictor to get the intercept and multiplier for the beta.

```r
# linear predictor without intercept
bhatx <- linear_model_predict(beta = beta_step1, x = as.matrix(x))

# Step 2
step2 <- glm(train_y ~ bhatx[train_data$patient_id] + S[train_data$patient_id],
  family = "binomial"
)
beta_step2 <- coef(step2)
beta_step2
```

```
##                    (Intercept) bhatx[train_data$patient_id]
##                     -1.9395295                    0.6361248
##      S[train_data$patient_id]
##                      0.6534730
# recover beta
beta <- beta_step2[2] * beta_step1
```

Compare selected features

```r
# LASSO
names(beta_lasso[!beta_lasso == 0])[-1]
```

ROC

```r
# mu
mu <- beta_step2[1] +
  as.numeric(as.matrix(x[test_data$patient_id, ])
  %*% beta[-1]) +
  as.numeric(beta_step2[3] %*% S[test_data$patient_id])
# expit
y_hat_twostep <- plogis(mu)

roc_twostep <- roc(test_y, y_hat_twostep)
```
ROC

The operating receiver characteristic (ROC) curve

LASSO, AUC=0.914
ALASSO, AUC=0.905
PheCAP, AUC=0.937
Two-step, AUC=0.88

Model Evaluation

Area under the ROC curve (AUC) from 600 simulations

method ⊟ LASSO ⊟ ALASSO ⊟ PheCAP ⊟ Two−step

MAP

```r
# Use untransformed data; MAP requires sparse matrix
# Create sparse matrix for surroagtes
data_fit <- sparsify(PheCAP::ehr_data %>%
  select(main_ICD, main_NLP) %>%
  rename(ICD = main_ICD) %>% data.table())

# Create sparse matrix for HU
note <- Matrix(PheCAP::ehr_data$healthcare_utilization,
  ncol = 1, sparse = TRUE
)
model_map <- MAP(mat = data_fit, note = note, full.output = TRUE)

## #######################
## MAP only considers pateints who have note count data and
##          at least one nonmissing variable!
## ####
## Here is a summary of the input data:
## Total number of patients: 10000
##   ICD main_NLP note  Freq
## 1 YES      YES  YES 10000
## ####
y_hat_map <- model_map$scores[data$validation_set]
roc_map <- roc(test_y, y_hat_map)
```
